

List of assumption

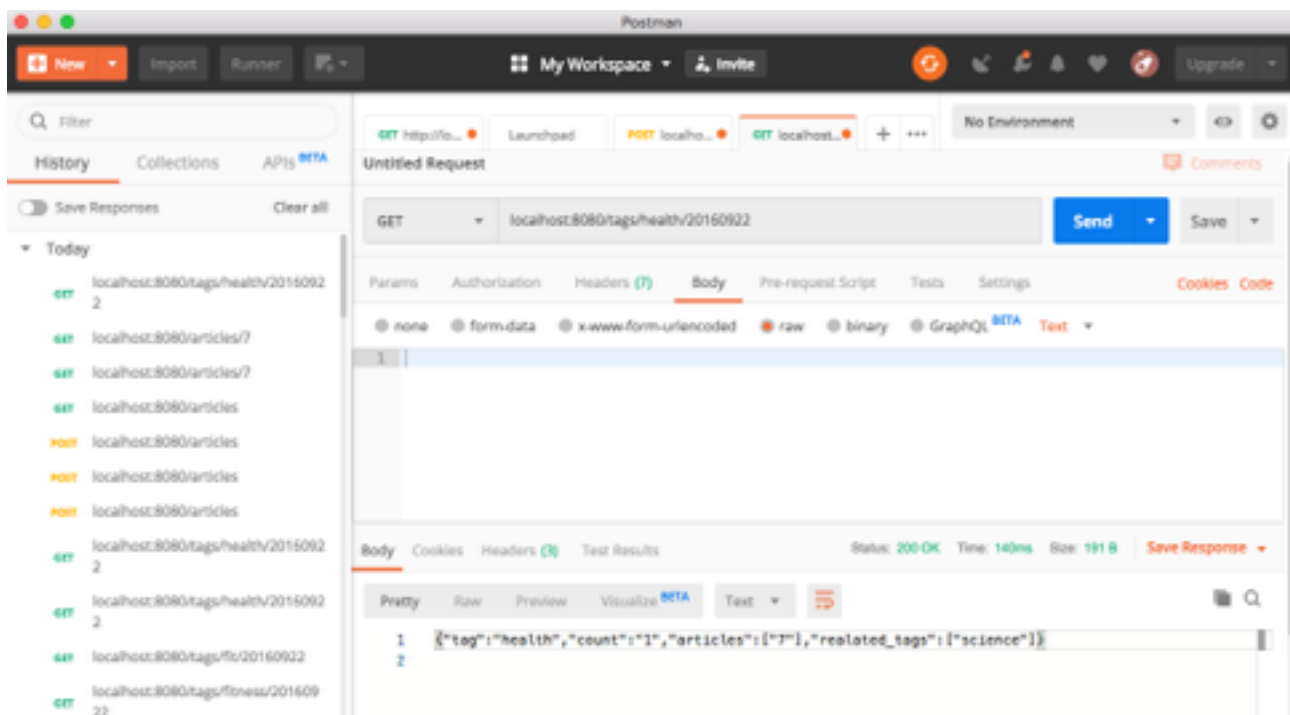

1. All the input JASON type is correct (I did not have enough time for error processing in this case)
2. The POST article alway create distince id. (The test requirements did not have the solution for handling the duplicate ID)
3. The GET article alway return exist article
4. When GET the tag that is not exist, return this tag with count = 0; realted_tag = nul, article = nul.

Usage of Postman to test web API

- Example of using Postman for POST method:

- Example of using Postman for GET 1 article method

Example of using Postman for GET tag name
